Quick Start

for Catakig X 3.0

❶ Make an Apple II

Choose *File › New Apple II…* (Command-N). Pick a model and extra memory, and click *Create*. The *ROM* pop-up chooses Apple's ROM or Catakig firmware, and the checkboxes add a Mockingboard (slot 2), clock card (slot 5) and mouse card (slot 7). Catakig remembers these choices.

Your first Apple II starts with the **demo disk**: press an item's key to try it. *Help › Open Demo Disk* brings it back any time. A new Apple II is switched off (static on the screen): press any key, or click the power button at the lower left.

❷ ROMs

The **][+** and **//e** run out of the box on **Catakig firmware**, original replacement firmware built into the app. Apple's ROMs are not included. For the **][** and **//c**, Apple's own ROM, or Apple's mouse card, choose *Catakig X › Import ROMs…* and pick ROM files you're entitled to use. Models with no ROM show in red in the New Apple II dialog.

❸ Disks

- Load a disk: click a drive's name below the screen, press F1 or F2, or drop a disk image on the screen (drive 1; hold Option for drive 2) or on a drive.
- Formats: DSK, DO, PO, NIB, 2IMG, WOZ, also inside ZIP and GZ files.
- Disks boot from drive 1. After loading one, click *Reboot*.
- Changes are written back to the file, in its own format, when the disk is unloaded. A **green** name is writable, **yellow** write-protected (ZIP, GZ, WOZ and locked files).
- Select a disk image in the Finder and press Space to see its catalog.

❹ Keyboard

Command / Option	Open-Apple / Solid-Apple
Control-F12	Reset (Control-Command-F12: Reboot)
← (left arrow)	Backs up over typing (Delete doesn't)
Command-V / C	Paste Text (typed in for you) / Copy Screen Text
F5 F6 F7 F8	Halt, normal, double, ×6 speed
F9	Monochrome / color

Most Mac keyboards need **fn** held down for F-keys. The **][** and **][+** have no lowercase, so Catakig types capitals.

❺ Joystick & mouse

Choose the joystick in *Catakig X › Preferences*: **Letter keys** (standard: Q W E / A S D / Z X C, while Caps Lock is off; turn Caps Lock on to type them), **Numeric keypad** (7–9 / 4–6 / 1–3, 0 and . are the buttons), **Mouse**, or a **Game controller** (left stick; A and B are the buttons; Menu is Escape). With the mouse card on, push the Apple II pointer past the screen's edge to get your Mac pointer back.

❻ Screen

View › Display offers Sharp Pixels, Scanlines and Composite Color (NTSC). Shift-Command-F is full screen; there, Shift-Control-Z slides up the drives and buttons.

❼ Saving & printing

- Quitting saves the front Apple II, which comes back next launch. Command-S saves a state file to open later.
- The printer is in slot 1 (BASIC: **PR#1**). Click the printer light to save what was printed, as PDF or text.
- *File › Save Screen Image* saves a picture of the screen.

❽ Help

The *Help* menu has the full *User Guide* (Command-?), *Troubleshooting & FAQ* and *Keyboard Shortcuts*. If something goes wrong, choose *Save Bug Report…* while it's on the screen and email the file to catakigx@icloud.com. Support: catakigx.github.io/Catakig-X

Good to know. Only the front Apple II runs, and only while Catakig X is the active app. Disks are written back only when unloaded, so eject them (or close the window) before copying the files elsewhere.
